Eribulin

What is eribulin (er-i-BUE-lin) and how does it work?
Eribulin is a chemotherapy drug known as an “anti-microtubule inhibitor”. Another name for this drug is Halaven™. It is a natural medicine that comes from a black sea sponge found in the ocean. It works by stopping fast growing cancer cells from dividing and making new cancer cells.

What should I tell my doctor before getting chemotherapy?
Talk to your doctor about the following:

- If you have ever had chemotherapy and the names of the chemotherapy drugs you were given.
- If you have ever had liver or kidney problems.
- If you have ever had changes in your heart rhythm or other heart problems.
- If you are pregnant or think you may be pregnant. Your doctor will talk with you about birth control while getting chemotherapy.
- If you are breastfeeding.
- If you have been told that you need to start a new medicine.
- The medicines/pills you are taking, including:
  - Medicines prescribed by any of your doctors
  - Herbs
  - Vitamins
  - Over-the-counter medicines

This handout is for informational purposes only. Talk with your doctor or health care team if you have any questions about your care.

How does my doctor decide my chemotherapy dose?
To determine your treatment dose, your doctor will review the following: your stage of cancer, your height, your weight, your medicines, how well your liver and kidneys are working, and any other health problems you have.

This drug is given one day per week for 2 weeks in a row followed by a week off. You will see the doctor or nurse practitioner about once every 3 weeks when you are getting this treatment.

Should I eat or drink before my treatment?
It is best to eat a small meal before getting your treatment. Drinking plenty of non-caffeinated fluids may also be helpful. However, if you have been told to limit fluids, check with your doctor about how much you can drink.

How will my treatment be given?
You will be given medicine 30 minutes before your treatment to prevent nausea or vomiting.

Eribulin is given directly into your blood stream through a tube (IV) placed in your arm or chest. Your nurse will stay with you while the Eribulin is given. This treatment will take about 5 minutes.

Your entire visit, including your doctor’s appointment and your treatment will take about 2 to 3 hours.

What are the side effects of this treatment?
Every person responds differently to treatment. Some of the more common side effects of this chemotherapy are:

- Numbness, tingling or pain in hands or feet
- Fatigue
- Irritation, pain or skin discoloration at the place where your chemotherapy was given
- Thinning or loss of your hair
- Constipation

Eribulin
• Loss of appetite and weight loss
• Nausea
• Low white blood cell count (may increase your risk for infection)
• Low hemoglobin (may cause you to have less energy and tire more easily)
• Mouth pain or open sores in the mouth
• Low platelet count (may cause you to bleed more easily or longer than normal and have more bruising)
• Muscle or joint aches and pain
• Cough

**When should I call my doctor?**

You should call your doctor right away if you have any of the following signs or symptoms:

• Fever of 100.4 degrees Fahrenheit (38 degrees Celsius) or higher

  **A fever can be life threatening if not treated. Your doctor may ask you to go to the hospital.**

• Chills, sore throat, cough or a wound that does not get better
• Numbness, tingling or pain that keeps you from doing simple tasks, such as walking, buttoning your shirt or holding a cup
• Nausea that prevents you from eating or drinking
• Skin redness or blisters at the place where your chemotherapy was given
• Bleeding or bruising, including bloody or black stools or blood in your urine
• Diarrhea (4 or more loose stools in 24 hours)
• Shortness of breath or difficulty breathing
• Changes in your heartbeat
• Open sores in your mouth

Eribulin
Is there anything else I should know about this treatment?

- Eribulin may cause changes in the electrical rhythm of your heart. Your doctor may order a test to check your heart before you start taking this chemotherapy drug and at times during your treatment.

- Your doctor will check the potassium and magnesium levels in your blood before your start chemotherapy and at times during your treatment.

- Chemotherapy may make it harder for your body to fight infections. Wash your hands often and avoid people who are sick.

- This treatment requires special precautions to prevent the chemotherapy drugs from coming into contact (through blood, urine, bowel movements, vomit and vaginal or seminal fluids) with others. Your chemotherapy nurse will give you guidelines to follow for 48 hours after receiving chemotherapy.

- Chemotherapy can change how your body reacts to vaccines. Talk to your doctor before getting any vaccines.

- You should drink 8 to 10 eight-ounce glasses of non-caffeinated fluid each day throughout your treatment. This is important to keep you hydrated while you are receiving chemotherapy.

- This treatment may cause women to stop having menstrual cycles. Depending on your age, your menstrual cycles may or may not return.

- This treatment may affect your ability to have children. Talk to your doctor before getting chemotherapy if you are planning to have children in the future.

For more information about cancer, chemotherapy, side effects or how to care for yourself during treatment, refer to your Chemotherapy and You book, or ask your doctor, nurse or pharmacist.
