TCH: Docetaxel, Carboplatin and Trastuzumab

What is TCH?
It is the short name for the medicines used for this cancer treatment. The 3 medicines you will receive during this treatment are Docetaxel (Taxotere or “T”), Carboplatin (or “C”) and Trastuzumab (Herceptin or “H”).

What is Docetaxel (doe-se-TAKS-el) and how does it work?
Docetaxel is a chemotherapy medicine known as an “anti-microtubule inhibitor”. Another name for this medicine is Taxotere. It is a natural medicine that comes from yew trees. This medicine fights cancer by stopping fast growing cancer cells from dividing and making new cancer cells.

What is Carboplatin (KAR-bo-pla-tin) and how does it work?
Carboplatin is a chemotherapy medicine known as an “alkylating agent”. Another name for this medicine is Paraplatin. This medicine is made in a laboratory. It stops fast growing cancer cells from dividing and making new cells by destroying the DNA of the cell.

What is Trastuzumab (tras-TOO-zoo-mab) and how does it work?
Trastuzumab is a type of targeted cancer therapy called a “monoclonal antibody”. Another name for this medicine is Herceptin. Trastuzumab seeks out cancer cells and attaches to the HER2 receptors, to prevent the cells from dividing and making new cancer cells. It also fights cancer cells by boosting your immune system.

This handout is for informational purposes only. Talk with your doctor or health care team if you have any questions about your care.

Why am I getting 3 treatment medicines for my cancer?

All 3 medicines work to stop fast growing cancer cells from dividing and making new cells. Each medicine attacks the cancer cells differently. Giving the 3 medicines together makes your treatment more effective.

What should I tell my doctor before my treatment?

Talk to your doctor about the following:

- If you have ever had chemotherapy or anti-cancer treatment and the names of the medicines you were given.
- If you have ever had heart, liver, lung or kidney problems.
- If you are allergic to mice.
- If you are allergic to medicines that contain polysorbate 80 or “Tween 80”.
- If you are pregnant or think you may be pregnant. Your doctor will talk with you about birth control when you take these medicines.
- If you are breastfeeding.
- If you have been told that you need to start a new medicine.
- The medicines/pills you are taking, including:
  - Medicines ordered by any of your doctors
  - Herbs
  - Vitamins
  - Over-the-counter medicines

How does my doctor decide my treatment dose?

To determine your treatment dose, your doctor will review the following: your height, your weight, your medicines, how well your heart, liver and kidneys work and any other health problems you have.

Six treatment doses are usually given. You will receive a treatment dose once every 3 weeks. You will see your doctor or nurse practitioner before each treatment.

After you have completed your treatment with TCH, you will continue to receive Trastuzumab. It will be given every 3 weeks, for a total of 12 months, from the time you started your TCH treatment.

TCH: Docetaxel, Carboplatin and Trastuzumab
Should I eat or drink before my treatment?
It is best to eat a small meal and drink plenty of fluids before your
treatment begins. If you have been told to limit fluids, check with your
doctor about how much you can drink.

How will my treatment be given?
You will be given several medicines 30 to 60 minutes before your
treatment to prevent nausea and vomiting and to prevent you from
having an allergic reaction. These medicines may affect your abilities.
For your safety, you should have someone drive you home.

Docetaxel is directly into your blood stream through a tube (IV) placed
in your arm or chest. Docetaxel comes in a bag with tubing attached.
Your nurse will connect the tubing to a pump. This treatment takes 60
minutes.

Carboplatin is given directly into your blood stream through a tube (IV)
placed in your arm or chest. Carboplatin comes in a bag with tubing
attached. Your nurse will connect the tubing to a pump. This treatment
takes 60 minutes.

Trastuzumab is given directly into your blood stream through a tube
(IV) placed in your arm or chest. Trastuzumab comes in a bag with
 tubing attached. Your nurse will connect the tubing to a pump. Your first
treatment takes 90 minutes. If you do not have any problems with your
first treatment, then your future treatments will last take only 30 minutes.
Your entire visit, including your doctor’s appointment and your treatment,
will take about 6 hours.

What are the side effects of this treatment?
Every person responds differently to treatment. Some of the more
common side effects of this treatment are:

- Nausea and/or vomiting that can last for several days
- Numbness, tingling or pain in your hands and feet
- Swelling of your hands, feet or ankles
- Fatigue
- Weakness
- Excessive tearing
- Changes in your nails
- Rash or other skin changes, including “hand and foot syndrome”. Hand and foot syndrome may cause tingling, numbness or pain on the palms of your hands and soles of your feet. Your hands and feet may become swollen or red and have small sores or blisters. Your skin may become very dry and begin cracking and peeling.
- Hair loss, including the hair on your head and body. This normally begins 10 to 14 days after treatment. A very rare side effect is that the hair on your head may not grow back, or it may only grow back on some areas of your head.
- Mouth pain or open sores in your mouth
- Low white blood cell count (may increase your risk for infection)
- Low hemoglobin (may cause you to have less energy and tire more easily)
- Low platelet counts (may cause you to bleed more easily or longer than normal and have more bruising)
- Muscle or joint aches and pain
- Decrease in the amount of electrolytes in your bloodstream (your doctor will check the amount of electrolytes in your blood before each treatment)
- Flu-like symptoms: chills, fever, headache, body aches and sweating (these are more common with your first few doses of Trastuzumab)
- Treatment related reactions including: difficulty breathing, hives, or swelling of your face
- Diarrhea
- Cough

When should I call my doctor?
You should call your doctor right away if you have any of the following signs or symptoms:

- Fever of 100.4 degrees Fahrenheit (38 degrees Celsius) or higher

  A fever can be life-threatening if not treated. Your doctor may ask you to go to the hospital.

- Chills, sore throat, cough or a wound that does not get better
- Open sores in your mouth
- Nausea that prevents you from eating or drinking
- Vomiting even after you have taken your anti-nausea medicine
- Bleeding or bruising, including bloody or black stools or blood in your urine
- Diarrhea (4 or more loose stools in 24 hours)
- Changes in your heartbeat
- Shortness of breath or difficulty breathing
- Swelling in your feet or ankles
- Fast weight gain
- Muscle or joint aches and pain
- No urine output for more than 12 hours
- Changes in your ability to hear
- Severe muscle cramps or twitching
- Severe tiredness, weakness or pain
- Signs of an allergic reaction, including:
  - Difficulty breathing, wheezing, chest pain or tightness
  - Swelling in your face, lips, tongue, or throat.
  - Rash

Is there anything else I should know about this treatment?

- **Trastuzumab** may cause problems with the pumping of your heart. Your doctor will check your heart before you start this medicine and every several months during your treatment.

- Some patients have allergic reactions while the **Docetaxel**, Carboplatin and Trastuzumab are being given. To prevent this, you will be given a medicine, called Dexamethasone, to take at home **before** your treatment. If an allergic reaction does happen, your nurse will give you medicine to help manage the reaction and take extra precautions during your next treatment.

- Some patients may have an allergic reaction while **Carboplatin** is being given or within a 1 to 2 days after treatment.
- If an allergic reaction happens during your treatment, your nurse will give you medicine to help manage the reaction and take extra precautions during your next treatment.

- You may also have a delayed allergic reaction 1 to 2 days after treatment. You will be given instructions on what to do if this happens.

• Cancer treatments may make it harder for your body to fight infections. Wash your hands often and stay away from people who are sick.

• This treatment requires special precautions to prevent the medicines from coming into contact (through blood, urine, bowel movements, vomit and vaginal or seminal fluids) with others. Your nurse will give you guidelines to follow for 48 hours after your treatment.

• Cancer treatments can change how your body reacts to vaccines. Talk to your doctor before getting any vaccines.

• It is important to keep hydrated during treatment. Unless told otherwise by your doctor, drink 8 to 10 cups of non-caffeinated fluid each day.

• **Docetaxel** may cause women to stop having menstrual periods. Depending on your age, your menstrual cycles may or may not return.

• This treatment may affect your ability to have children. It may be hard to get pregnant even after your treatment has ended. Talk to your doctor before you start treatment if you are planning to have children in the future.

For more information about cancer, cancer treatments, side effects or how to care for yourself during treatment, ask your doctor, nurse or pharmacist.
