Our housekeeping staff uses an ultraviolet cleaning system as an added method of cleaning to reduce the risk of infections in the hospital. It is a newer technology that is a safe way to kill germs on all surfaces in the room to protect you, your visitors and others in the hospital.

**About the system**
Tall, round units on wheels are used to deliver the UV-C light rays or energy. The UV-C energy has been shown to kill germs safely.

**Use of the system in your room**
We will use the unit in the bathroom each day. The unit will be set up and run for less than 10 minutes. The bathroom door will be closed and a sign will alert people not to enter. The unit will shut off if you need to enter the bathroom.
