Pulmonary Function Testing

Pulmonary function testing is done to check the function of your lungs. These tests measure both amount of air you move in and out of your lungs and how easy it is for you to breathe.

Tests may be done to:

- Help your doctor diagnose lung disease or other lung conditions, like asthma.
- Monitor how your lung function may change over time.
- Help find what treatment may help you.
- Check your lungs if general anesthesia is needed for surgery. The results help the doctor know if you may have breathing problems after anesthesia.

Before the Test

- Do not smoke for 4 to 6 hours before the test.
- You may eat before the test, but only eat a small meal. If you eat a large meal, it will give you a full stomach. This will decrease your ability to take deep breaths and do the tests well.
- The doctor may request a pulmonary function test to check the effect of your breathing medicine(s) given by mouth and/or inhaler. Your regular medicine may be stopped for a time until you take the test. Your doctor or the testing center will tell you which medicines you need to hold and for how long before the test. You will then be tested both before and after you inhale the medicine.
During the Test

- Pulmonary function tests are done in the Pulmonary Function Laboratory. A technician will help you do the tests. You will be asked to breathe into different machines.

- The technician will give you specific instructions for each of the tests. For example, you may be asked to breathe in as deeply as you can and then blow air out as fast as you can. You also may be asked to breathe normally, and then take in as big a breath as you can and to hold your breath for several seconds. You will repeat the test several times. Accurate measurements depend on you following the instructions and giving your best effort.

- A nose clip will be put on your nose so that you breathe through your mouth during the test. If air escapes through your nose, incorrect measurements may occur.

- You may be given a medicine to inhale. Some tests will then be repeated to see the effect or benefit of the medicine.

- The breathing exercises may make you tired or short of breath. You will be given rest periods during the test if you need them.

- The doctor also may take a blood sample to check the amount of oxygen, carbon dioxide or hemoglobin in your blood.

After the Test

- The results of the test are reported to your doctor. Your doctor will discuss the test results with you.

- There are no side effects from these tests. You may feel tired and want to rest after the test is over.

Talk to your doctor or others on your health care team if you have questions. You may request more written information from the Library for Health Information at (614) 293-3707 or email: health-info@osu.edu.
